

11.Docker容器绑定外部端口和IP

1.Docker允许通过外部访问容器或者容器之间互联的方式来提供网络服务。 2.首先是外部访问容器：

- 容器启动之后，容器中可以运行一些网络应用，通过-p或-P参数来指定端口映射，使用-P（大写）标记时，docker会随机选择一个端口映射到容器内部开放的网络端口上。

```
[root@bigdata-4 ~]# docker run -d -P training/webapp python app.py
60b684d32e043479b102ef6b93a5c0138da7b767727b0058ee4fff713b268418
[root@bigdata-4 ~]# docker ps
```

CONTAINER ID	IMAGE	COMMAND	CREATED	STATUS	PORTS
60b684d32e04	training/webapp	"python app.py"	31 seconds ago	Up 30 seconds	0.0.0.0:32769->5000/tcp

```
peaceful_euler
```

此时访问本机的32769端口就可以访问到容器内web应用提供的界面。

也可以使用docker logs来查看应用的信息

```
hive
[root@bigdata-4 ~]# docker logs peaceful_euler
* Running on http://0.0.0.0:5000/ (Press CTRL+C to quit)
192.168.72.1 - - [17/Sep/2019 14:37:54] "GET / HTTP/1.1" 200 -
192.168.72.1 - - [17/Sep/2019 14:37:57] "GET /favicon.ico HTTP/1.1" 404 -
[root@bigdata-4 ~]#
```

- 使用-p（小写）则可以指定要映射的端口，并且在一个指定端口上只可以绑定一个容器，支持的格式有：

```
ip:hostport:containerport ip::containerport hostport:containerport
docker run -d -p 5000:5000 training/webapp python app.py
```

```
[root@bigdata-4 ~]# docker run -d -p 5000:5000 training/webapp python app.py
c829f830fa2c344ff5102d5ea71fdb29389ea8b7e571d6a511cac743berb640
/usr/bin/docker-current: Error response from daemon: driver failed programming external connectivity on endpoint elastic-leavitt (995e45b940c8b9d7866731b6fbadd6b1f5b40ac330eaac6ea915edd52c546acc): Bind for 0.0.0.0:5000 failed: port is already allocated.
[root@bigdata-4 ~]# netstat -nlpt | grep 5000
tcp6      0      0      *          *          *          *
tcp6      0      0      *          *          *          *
[root@bigdata-4 ~]# docker run -d -p 5001:5000 training/webapp python app.py
cdfd4d1e670a0040698388f8fb140e2fa8c20b13f5ad665d26ffde62229a2d76
[root@bigdata-4 ~]# docker logs cdfd4d1e670a0040698388f8fb140e2fa8c20b13f5ad665d26ffde62229a2d76
* Running on http://0.0.0.0:5000/ (Press CTRL+C to quit)
192.168.72.1 - - [17/Sep/2019 14:48:14] "GET / HTTP/1.1" 200 -
192.168.72.1 - - [17/Sep/2019 14:48:15] "GET /favicon.ico HTTP/1.1" 404 -
[root@bigdata-4 ~]#
```

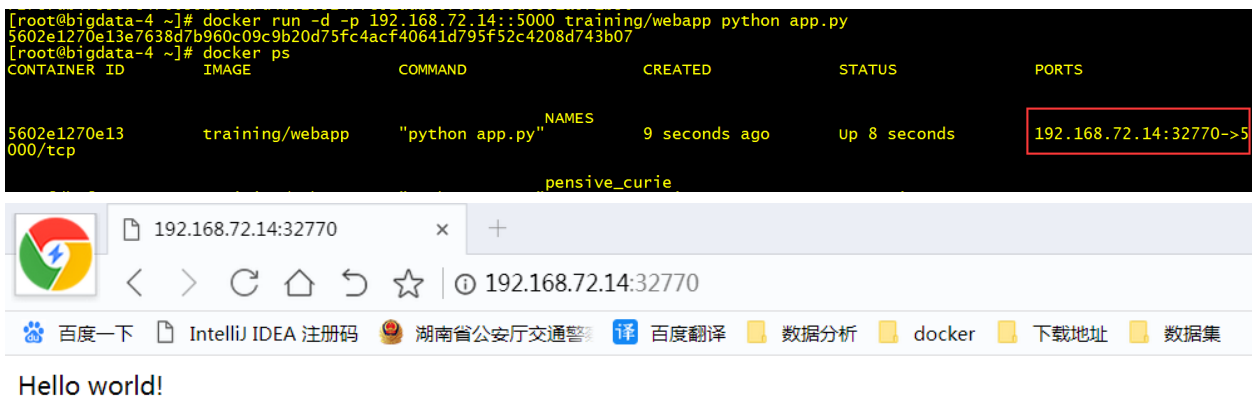

看到本地5000端口已经被映射，换一个端口5001运行成功，在页面上输入5001端口访问如下

- docker 默认会映射本地所有的地址。现在我们来尝试一下映射到指定地址的指定端口 `docker run -d -p 192.168.72.14:5003:5000 training/webapp python app.py`

接下来绑定本机的任意端口到容器的5000端口 `docker run -d -p 192.168.72.14::5000 training/webapp python app.py`

还可以指定通信协议 `docker run -d -p 5003:5000/udp training/webapp python app.py`

```
h1ve
[root@bigdata-4 ~]# docker run -d -p 5003:5000/udp training/webapp python app.py
a48ade074be656011c081f22faebfb291db2087faf6c8a5e974becfb1eafd70e
[root@bigdata-4 ~]# docker run -d -p 5004:5000/tcp training/webapp python app.py
84697d0b11184c138398d377d9307c4a1f5affd39501f50ff2025f521676286e
[root@bigdata-4 ~]#
```

那我们怎样来查看docker里面容易绑定和映射的端口及ip地址呢？可以使用`docker port`

```
[root@bigdata-4 ~]# docker port 84697d0b11184c138398d377d9307c4a1f5affd39501f50ff2025f521676286e
5000/tcp -> 0.0.0.0:5004
[root@bigdata-4 ~]#
```

需要注意的是：a.容器内部有自己的内部网络和ip地址，可以使用`docker inspect`来查看

```

    "Error": "",
    "StartedAt": "2019-09-17T15:01:29.650752913z",
    "FinishedAt": "0001-01-01T00:00:00z"
  },
  "Image": "sha256:6fae60ef344644649a39240b94d73b8ba9c67f898ede85cf8e947a887b3e6557",
  "ResolvConfPath": "/var/lib/docker/containers/84697d0b11184c138398d377d9307c4a1f5affd39501f50ff2025f521676286e/resolv.c
onf",
  "HostnamePath": "/var/lib/docker/containers/84697d0b11184c138398d377d9307c4a1f5affd39501f50ff2025f521676286e/hostname",
  "HostsPath": "/var/lib/docker/containers/84697d0b11184c138398d377d9307c4a1f5affd39501f50ff2025f521676286e/hosts",

  "Driver": "overlay2",
  "MountLabel": "",
  "ProcessLabel": "",
  "AppArmorProfile": "",
  "ExecIDs": null,
  "HostConfig": {
    "Binds": null,
    "ContainerIDFile": "",
    "LogConfig": {
      "Type": "journald",
      "Config": {}
    },
    "NetworkMode": "default",
    "PortBindings": {
      "5000/tcp": [
        {
          "HostIp": "",
          "HostPort": "5004"
        }
      ]
    }
  }
}

```

b.在启动容器的时候，可以多次使用-p标记来绑定多个端口 `docker run -d -p 5005:5000 -p 5006:80 training/webapp python app.py`

```

[root@bigdata-4 ~]# docker run -d -p 5005:5000 -p 5006:80 training/webapp python app.py
2d7902d929f290446f1c8049d38b5d762e914dfc87055d68a9e88145338fb433
[root@bigdata-4 ~]# docker port 2d7902d929f290446f1c8049d38b5d762e914dfc87055d68a9e88145338fb433
80/tcp -> 0.0.0.0:5006
5000/tcp -> 0.0.0.0:5005
[root@bigdata-4 ~]# █

```
